TE-8C-MD, TE-8K-MD TE-8S-MD TE-10K-MD

MODEL ABBREVIATIONS:

C = Polypropylene, K = Kynar, S = Stainless Steel
 TE = Totally Enclosed Fan Cooled Motor, MD = Magnetic Drive

DESCRIPTION: Series 8 & 10 are centrifugal magnetic drive pumps, eliminating the need for a shaft seal. These pumps can be serviced with an adjustable wrench. Screws should be tightened in sequence and uniformly. Do not over tighten the screws or you may crush the plastic housing bosses. See the repair parts list for a breakdown of replacement parts.

OPERATION: These pumps are not self-priming, lack a suction lift, and thus require a **flooded suction**. These pumps **cannot be run dry** because the impeller requires the liquid being pumped for lubrication. The direction of motor rotation should be clockwise when facing the inlet of the pump. For liquids with a specific gravity greater than water, have a higher viscosity, or for elevated temperatures, a trimmed impeller may be necessary. For application assistance, contact March Pump.

ELECTRICAL: Models are 230/460V, 3 phase, TEFC. Motors are U.L. listed and rated for continuous duty Explosion proof and special voltage motors are available upon special order.

NOTES: All specifications & data are based on pumping water & are intended as a guideline only. Specifications may vary with different motors.

When replacing impeller bushings on the TE-8 models in the field, the plastic bushings must be bored to size after they have been pressed into the impeller. Bore to 0.630/0.632 I.D. The carbon & ceramic bushings are to finished size and do not require boring. When attaching the drive magnet to the motor shaft, position the face of the drive magnet 3/8 inch below (For TE-8) and 3/16 inch above (For TE-10) the face of the motor bracket.

LIMITED WARRANTY: March pumps are guaranteed only against defects in workmanship or materials for a period of one year from date of manufacture pumping water. For the complete warranty and to register online go to www.marchpump.com/warranty-registration

CAUTION IN ASSEMBLY AND DISASSEMBLY: On the TE-10, the magnetic coupling in the pump is strong enough to warrant caution. When servicing the pump, the attraction of the impeller magnet and drive magnet may pull the impeller from your grasp. When assembling, hold onto the outer diameter of the impeller vanes with both hands and gently engage the impeller into the magnet field. Hold the impeller firmly and resist the magnetic attraction as you slowly put the impeller back in. The magnetic forces are strongest between 1/3 to 2/3 of engagement and will diminish when the magnets become aligned. Do not allow the impeller to snap into the rear housing, doing so may result in damage. Exercise caution in placing any of the magnets near steel, tools, or other sensitive instruments as doing so may result in damage or personal injury.
