

DEPCO, THE DISTRIBUTOR'S DISTRIBUTOR, ADDS MORE VALUE THAN EVER BEFORE

In a lot of instances, a pump right out of the box will not meet your customer's fluid handling requirement. Don't miss any opportunities....call Depco!!

We can fabricate, modify, assemble, machine, detail, and test our pumps no matter how tough the duty. Simple impeller trim? No problem. Swap out elastomers on an air operated double diaphragm pump? No problem. Base-mount a gear pump to a gasoline engine? No problem. Assemble a sanitary lobe pump to a washdown duty electric motor via a 3:1 gearbox mounted on a polished 304 stainless steel baseplate with a variable frequency control box wired to the motor and tested? You got it; no problem.

Here are some of the more interesting examples we have done recently:

A cruise line required a central high pressure washdown pump system to provide high pressure water at several delivery points on one of their luxury liners. Through our distributor we provided a Cat 3520 pump that was directly driven by a gear motor. Everything was mounted on a very compact skid (space is a premium on a cruise ship), along with all the bells and whistles.

Our distributor's customer was a major oil company that needed some sealless, high pressure crude oil pumps to go into a pipeline application located in an environmentally sensitive area. Depco provided Hydracell pump-motor units complete with special 316SS heads and special weld-on flange connections. This innovative packaged solution has been re-ordered several times by this customer.

One of our partner distributors needed some small but mighty acid transfer and recirculation pumps to simulate "real-time" system performance in a pilot plant before building an entirely new, full scale chemical plant. Together we chose Jabsco's "New Gen" 316SS flexible impeller pumps mounted on 316SS bases with inverter duty gear motors. This provided the customer with the versatility they needed during the R & D stage of their project.

One of our dealers services an OEM that makes ozone generating equipment for water and wastewater plants as part of the purification process. They required some sturdy, 24-7, 365 high service pumps for ozonated water circulation. We chose an Ampco IC series 316SS pumps with silicon carbide seals and the flanged connection option. This provided the user with a pump that will perform over the long haul at a very reasonable investment.

A large, multi-branched supply company that has been a customer of Depco's for many years had a customer that is a maker of cosmetics and personal care products. They needed a sanitary, hygienic, easy to clean pump to transfer shampoo and other hair products to their bottling line. The Jabsco Hy-Line Lobe pump fit the application perfectly. We coupled it to the gearmotor and mounted everything on a polished stainless steel base.

Problem: salad dressing transfer from several locations for a condiment manufacturer. The solution: a Jabsco sanitary "New Gen" 316SS flexible impeller pump, sanitary cart mounted to a 90 vdc/115 vac input variable speed control. This versatile pump can be used anywhere in the plant on many different products, cleans up very easily, is portable, and very economical to purchase and operate.
