ASSEMBLY
Unpack pump from carton and check for shipping damage.

⚠️ WARNING: Magnetic field hazard. This pump contains powerful rare earth magnets. When the pump is disassembled (not connected to a motor) and the magnets are exposed, these magnets produce powerful magnetic fields. Individuals with cardiac pacemakers, implanted defibrillators, other electronic medical devices, metallic prosthetic heart valves, internal wound clips (from surgery), metallic prosthetic device or sickle cell anemia must not handle or be in the proximity of the magnets contained inside the pump. Consult a health care provider for specific recommendations before working with this pump.

ATEX COMPLIANT PUMPS
All assembly, installation, and maintenance instructions are the same as standard pumps with the exceptions noted on page 3 under "Safety Precautions for ATEX pumps."

PUMPS WITH MOTORS
Remove shipping plugs and insert from suction and discharge and proceed to installation instructions.

PUMPS WITHOUT MOTORS
1. Remove wet end assembly from box.
   ⚠️ CAUTION: Strong magnets present. Keep metal objects and metallic chips/particles away from pump components.
2. Remove hardware package from box.
3. Install motor adapter (item 6) onto motor with labels at top using items 10 and 11.
   ⚠️ WARNING: Components can slam together from strong magnets. Keep fingers away from area between housing and motor adapter.
4. Remove drive mag assembly (item 5) from box and slide assembly onto motor shaft making sure shaft key (item 12) is in place. Installation dimension is .060 +/- .010 inches as shown in Figure 1. Tighten 2 set screws (item 5A) to 228 in-lbs. (25.8 N-m).
   ⚠️ IMPORTANT: Verify the tightness of the set screws in the drive magnet assembly prior to operation.
5. Gripping the discharge and the side of the impeller housing (note above warning), carefully install the wet end into the motor adapter. Note that the two housing studs (item 15) should be located at 3 and 9 o’clock (for 12 o’clock discharge location) and will go through the motor adapter.
6. Install the 5/16 x 3/4 SS hex bolts (item 7), the 5/16 flat washers (item 9), and the 5/16 hex nuts (item 8) and tighten to 70 in-lbs. of torque using the pattern shown in figure 2.
7. Remove the two-piece shipping plug from the suction.
8. Reach into the suction and spin the impeller to check if it spins freely. If it does not, disassemble and recheck the drive hub installation instructions in step 4
9. Install pump into the system according to the following installation instructions.

INSTALLATION MOUNTING
Motor or base plate should be securely fastened.

PIPING
1. Support piping near the pump to minimize strain on pump casing.
2. To minimize head loss due to friction:
   a. Increase pipe size 1 diameter
   b. Use minimal number of bends
3. Keep pipe bends a minimum of 10 pipe diameters from suction and discharge. For example, if using 2" pipe, first bend should be at least 20" from suction discharge.
4. Position pump as close to liquid source as possible.
5. Maintain a flooded suction.
6. Ensure that piping is leak proof.
7. Install valves on suction and discharge lines (minimum of 10 pipe diameters from pump).
8. For units in suction lift system, install appropriate piping in
discharge to allow priming of pump.
9. The suction valve should be fully open to avoid restricting suction flow.

**IMPORTANT:** To protect the pump if prime is lost, use one of the following: (1) pressure switch on the discharge; (2) vacuum switch on the suction; (3) a power monitor to monitor motor current.

10. When pumping liquids which may solidify or crystallize, a flush system should be added to the piping. See Figure 3. Install water inlet and outlet valves as shown.

**ELECTRICAL**
Install motor according to NEC requirements and local electrical codes.

**IMPORTANT:** To verify correct motor rotation: (1) Install pump into system. (2) Fully open suction and discharge valves. (3) Allow fluid to flow into the pump.

![Diagram of pump components](image)

---

**OPERATION**

**START UP**
1. This pump must be filled from a flooded suction tank (gravity) or primed with liquid from an outside source. The KC22/32 are not self-priming.
2. Open the inlet (suction) and discharge valves completely and allow the pump to fill with liquid.
3. Close the discharge valve.
4. Turn the pump on. Slowly open the discharge valve. Adjust the flow rate and pressure by regulating the discharge valve. Do not attempt to adjust the flow with the suction valve.
5. Use of a power monitor is strongly recommended for pumps with ceramic, PTFE or silicon carbide bushings. The power monitor will stop the pump and help prevent damage should the pump run dry. ATEX certified pumps MUST use a power monitor.
6. Use of a power monitor is strongly recommended for pumps with ceramic, PTFE or silicon carbide bushings. The power monitor will stop the pump and help prevent damage should the pump run dry. ATEX certified pumps MUST use a power monitor.

**SHUT DOWN**

Use the following procedure to shutdown the pump.
1. Slowly close the discharge valve.
2. Turn off the motor.
3. Close the suction valve.

**FLUSH SYSTEM**

1. Fully close suction and discharge valves.
2. Connect water supply to water inlet valve.
3. Connect drain hose to water outlet valve.
4. Open inlet and outlet valves, and flush system until pump is clean (approximately 5 minutes).

**MAINTENANCE**

**DISASSEMBLY**

1. Disconnect power. Remove electrical wiring and mounting bolts to floor or base plate.
2. Close suction and discharge valves, and disconnect piping.
3. Remove bolts, nuts and washers (items 7, 8 and 9). Leave the 2 housing studs (item 15) in place until the wet end is removed.
4. Securely clamp or hold motor in place. Remove wet end assembly by inserting both thumbs into pump suction and pulling assembly straight out with a quick motion.

**WARNING:** Components can slam together from strong magnets. Keep fingers away from area between housing and motor adapter.

5. Disassemble wet end by removing 2 housing studs and nuts (items 16) which attach barrier (item 4) to impeller housing (item 1). Remove and discard o-ring (item 13).
6. Remove drive magnet assembly by inserting a 3/16” hex wrench into access hole in side of motor adapter and loosening 2 set screws (item 5A). Grasp inside of magnet assembly and pull off of motor shaft.

**CAUTION:** Strong magnets present. Keep metal objects and metallic chips/particles away from pump components.

**EXAMINATION**

1. Check impeller drive bushing (item 3A) and impeller thrust washer (item 2A). If cracked, chipped or scored, then replace. Replace if minimum groove height is less than the minimum height recommended. See Figure 4.
2. Check for loose magnets.

**IMPELLER DISASSEMBLY**

1. To separate impeller body (item 2) from the impeller drive (item 3), support the body in an arbor press using two 5” minimum spacer blocks.
2. Insert a 1-1/2” diameter plastic or wooden shaft into the impeller eye, and push the drive out of the body. See Figure 5.
SAFETY PRECAUTIONS FOR ATEX PUMPS

CAUTION: Proper o-ring material must be chosen for the fluid being pumped. Improper material selection could lead to swelling and be a possible source of leaks. This is the responsibility of the end user.

WARNING: The pump must be checked for leaks on a regular basis. If leaks are noticed, the pump must be repaired or replaced immediately.

WARNING: The pump must be cleaned on a regular basis to avoid dust buildup greater than 5 mm.

WARNING: ATEX pumps must use a power monitor, flow switch, pressure switch or similar device to help protect against dry running, closed discharge valve and decoupling. Any of these conditions could lead to a rise in surface temperature of the pump.

TEMPERATURE CLASSIFICATION

The surface temperatures of the KC ATEX Series pumps depend upon the temperature of the fluid being pumped. The chart below lists different fluid temperatures and the corresponding pump surface temperatures.

<table>
<thead>
<tr>
<th>Maximum Temperature</th>
<th>Surface Temperature</th>
<th>Allowable Temperature Class</th>
<th>Surface Temperature</th>
</tr>
</thead>
<tbody>
<tr>
<td>80°F (27°C)</td>
<td>122°F (50°C)</td>

<td>248°F (120°C)</td>
<td>T3</td>
<td>200°C</td>
</tr>
</tbody>
</table>

TROUBLESHOOTING

NO FLOW
1. Pump not primed.
2. Discharge head too high. Insufficient NPSH.
3. Suction lift too high.
5. Viscosity too high (magnets uncoupled).

INSUFFICIENT DISCHARGE
1. Air leaks in suction piping.
2. Discharge head higher than anticipated.
3. Suction lift too high or insufficient NPSH. Check also for clogged suction line or clogged foot valve.
4. Foot valve too small.
5. Foot valve or suction open or not submerged enough.

CHEMICAL REACTION DISCLAIMER

The user must exercise primary responsibility in selecting the product's materials of construction, which are compatible with the fluid(s) that come(s) in contact with the product. The user may consult Finish Thompson, Inc. (manufacturer) and/or a manufacturer's representative/distributor agent to seek a recommendation of the product's material of construction that offers the optimum available chemical compatibility.

However, neither manufacturer nor agent shall be liable for product damage or failure, injuries, or any other damage or loss arising out of a reaction, interaction, or any chemical effect that occurs between the materials of the product's construction and fluids that come into contact with the product's internals.

WARRANTY

Finish Thompson, Inc. (manufacturer) warrants this pump product to be free of defects in materials and workmanship for a period of one year from date of purchase by original purchaser. If a warranted defect, which is determined by manufacturer's inspection, occurs within this period, it will be repaired or replaced at the manufacturer's option, provided:

1. The product is returned to manufacturer with proof of purchase.
2. Transportation charges are prepaid.
3. The warranty does not apply to products or parts broken due to, in whole or in part, accident, overload, abuse, chemical attack, tampering, or alteration.
4. The warranty does not apply to any other equipment used in combination with this product.
5. The manufacturer accepts no responsibility for product damage or personal injuries sustained when the product is modified in any way.
6. If this warranty does not apply, the purchaser shall bear all cost for labor, material and transportation.

Manufacturer shall not be liable for incidental or consequential damages including, but not limited to process down time, transportation costs, costs associated with replacement or substitution products, labor costs, product installation or removal costs, or loss of profit. In any and all events, manufacturer's liability shall not exceed the purchase price of the product and/or accessories.

INSUFFICIENT PRESSURE

1. Air or gases in liquid.
2. Impeller diameter too small.
3. Discharge head higher than anticipated.

LOSS OF PRIME

1. Leaking suction line.
2. Suction lift too high or insufficient NPSH.
3. Air or gases in liquid.
4. Foreign matter in impeller.
5. Leaking foot valve.

EXCESSIVE POWER CONSUMPTION

1. Head lower than rating. Pumps too much liquid.
2. Specific gravity or viscosity of liquid pumped is too high or higher than that defined in application.

VIBRATION

1. Excessive bushing wear.
2. Drive magnet uncoupled.
3. Loose magnet.
4. Pump cavitation.

ORDERING OF SPARE PARTS

Spare parts can be ordered from your local distributor. Always refer to pump model number to avoid error.

OTHER FINISH THOMPSON PRODUCTS

Drum Transfer Pumps are available in sanitary construction, stainless steel, polypropylene and CPVC. Flows to 40 gpm, discharge heads to 80 feet and viscosities to 100,000 cP.

Portable Mixers for turbine mixing and blending handle viscosities to 1,000 cP with gentle, non-vortexing circulation. Available in 316 stainless steel construction.

Centrifugal Pumps in 316 SS, ETFE lined cast iron, polypropylene and PVDF come with a wide variety of sealing materials. Flows to 330 gpm, discharge heads to 130 feet and temperatures to 220°F (104°C).
